Common Medical Image Analysis Tasks

Localisation

Output: bounding boxes

Classification

Output: tumour/no tumour

Semantic Segmentation

Output: segmentation map

Example: classification

Image
Classification
Algorithms

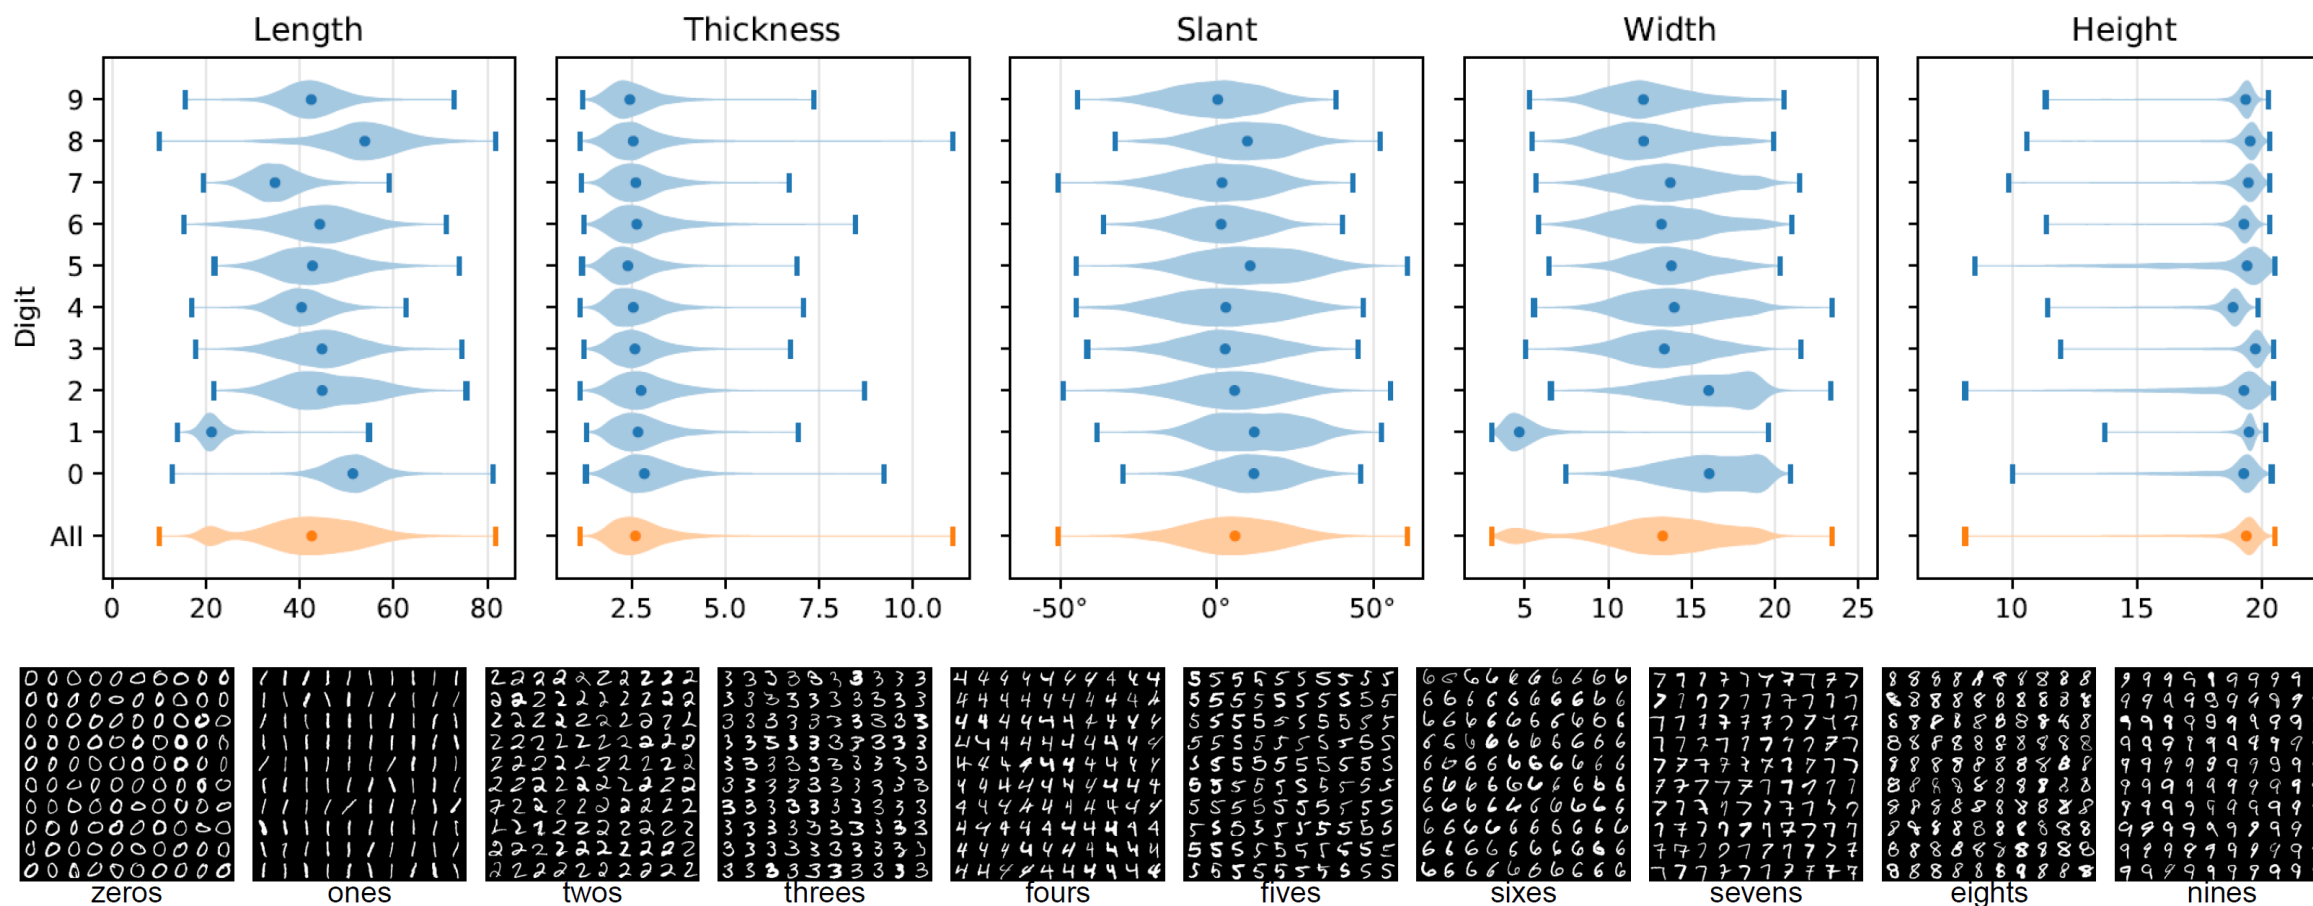

With/without
tumour

Classification

Just an array of numbers

Classification

Convolution

Input Image

a_{11}	a_{12}	a_{13}	...	a_{1n}
a_{21}	a_{22}	a_{23}	...	a_{2n}
a_{31}	a_{32}	a_{33}	...	a_{3n}
\vdots	\vdots	\vdots		\vdots

Mask

m_{11}	m_{12}	m_{13}
m_{21}	m_{22}	m_{23}
m_{31}	m_{32}	m_{33}

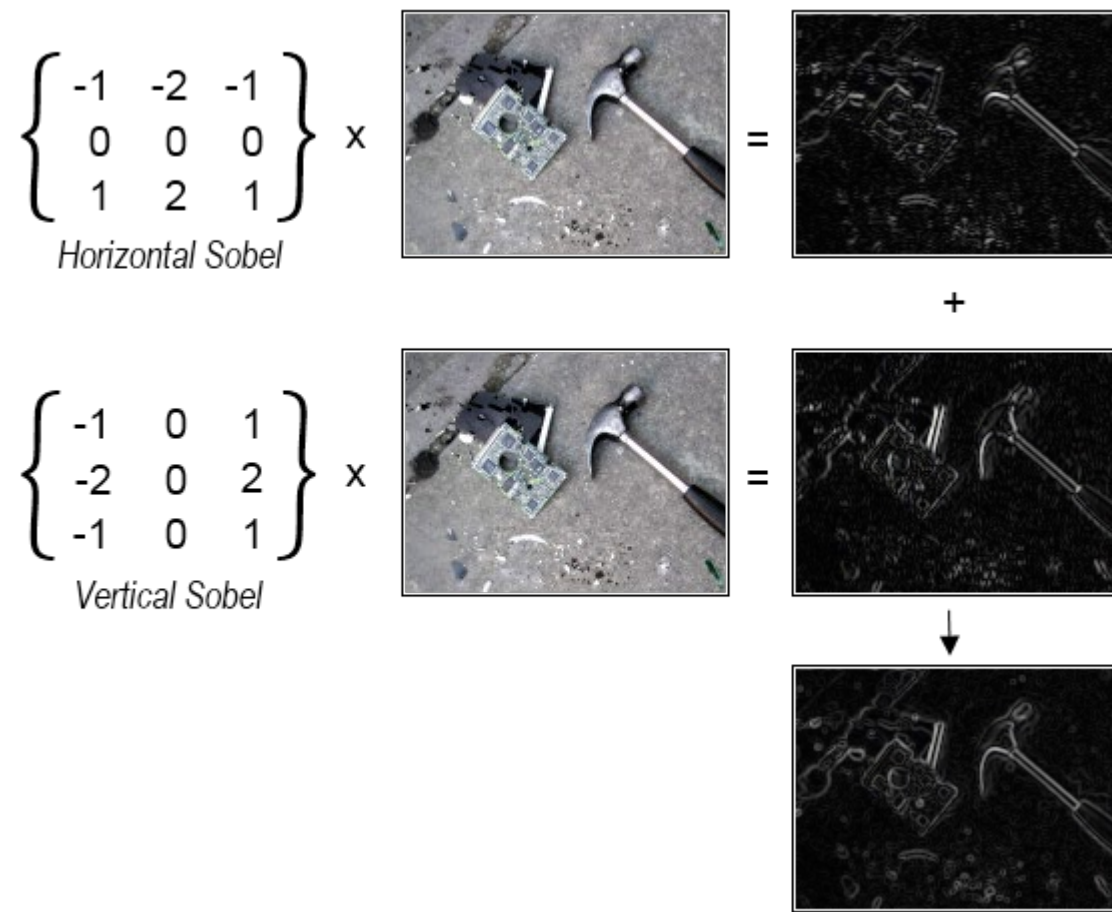

Output Image

b_{11}	b_{12}	b_{13}	...	b_{1n}
b_{21}	b_{22}	b_{23}	...	b_{2n}
b_{31}	b_{32}	b_{33}	...	b_{3n}
\vdots	\vdots	\vdots		\vdots

$$b_{22} = (a_{11} * m_{11}) + (a_{12} * m_{12}) + (a_{13} * m_{13}) + (a_{21} * m_{21}) + (a_{22} * m_{22}) + (a_{23} * m_{23}) + (a_{31} * m_{31}) + (a_{32} * m_{32}) + (a_{33} * m_{33})$$

Convolution

Convolution

Sobel filter

Classification

CNN model

Project Workflow

- Understand and preprocess your dataset
- Build the model
- Train the model
- Find the optimal hyperparameters
- Evaluation

Brain MRI

- Non-invasive imaging technology
- Produce three dimensional detailed anatomical images
- Used for disease detection, diagnosis, and treatment monitoring

Brain MR Images

Different MRI sequences

Classification Dataset

- 5391 images are given to you for training and testing the model.
- All the images have been preprocessed for you for better training result.

Brain image
with tumour

Brain image
without tumour

Segmentation Dataset

- 251 MRI volumes and segmentation maps are given to you for training the model. Around 100 volumes will be given to you on 19th August for testing your model.
- All the MRI volumes have not been preprocessed.

Brain tumour
in 3D

Data preprocessing

- Denoise
- Standardise images (resize, normalisation, etc)
- Data augmentation (rotation, sheer, scale, etc)

Build the classification model

Preprocessed
dataset

CNN-based backbone model for feature
extraction (VGG16, AlexNet, ResNet, etc)

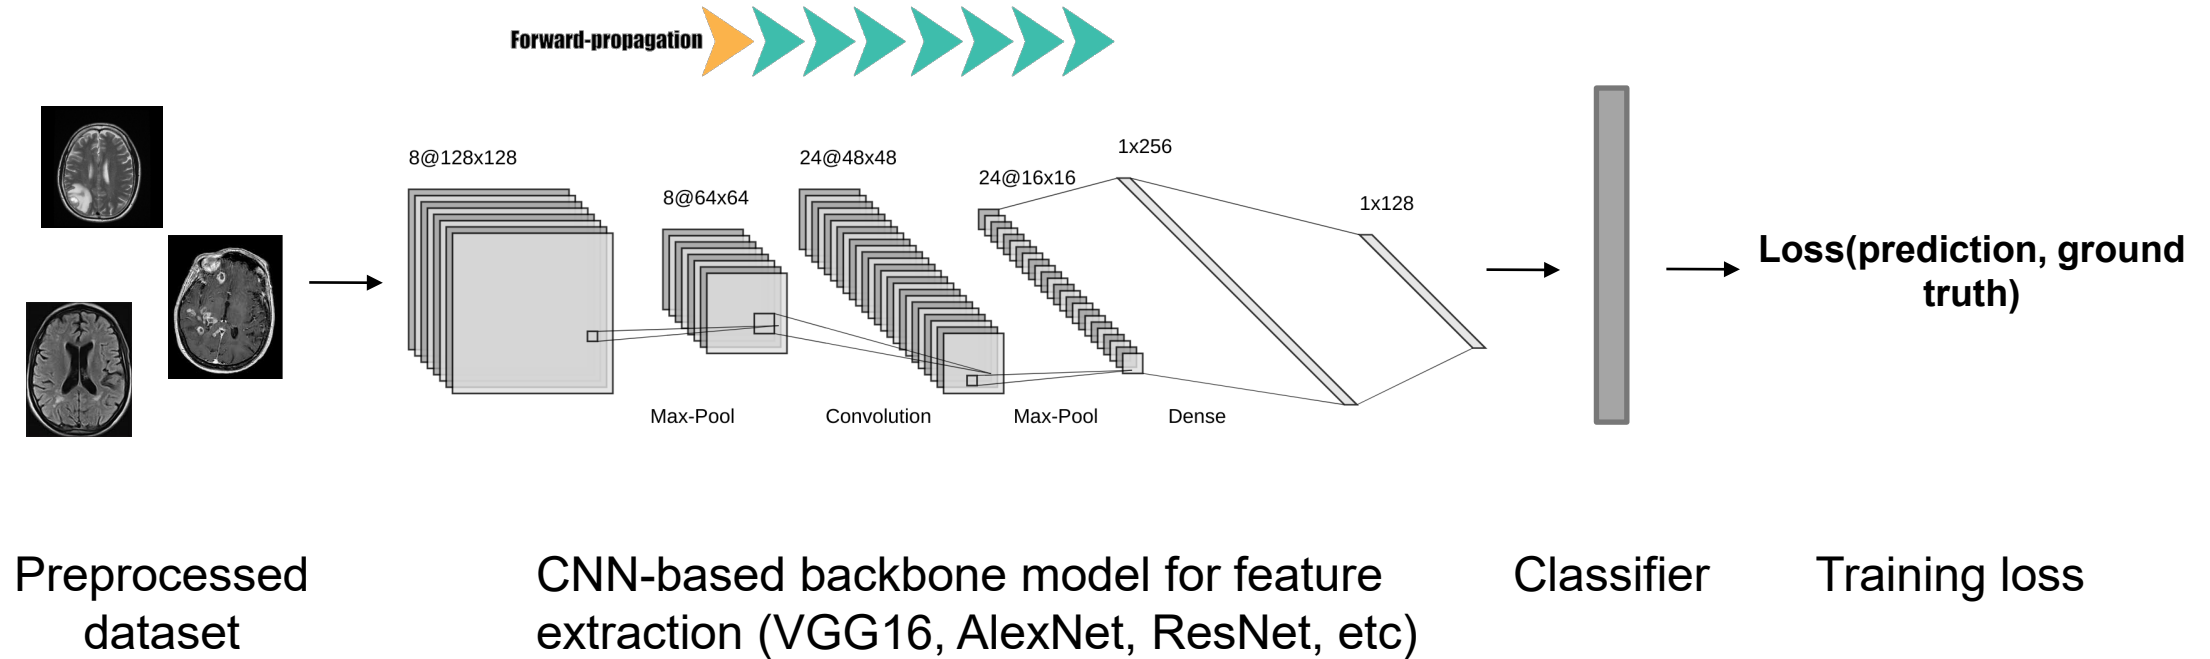

Classifier

Probability
 $p \in (0,1)$

Output

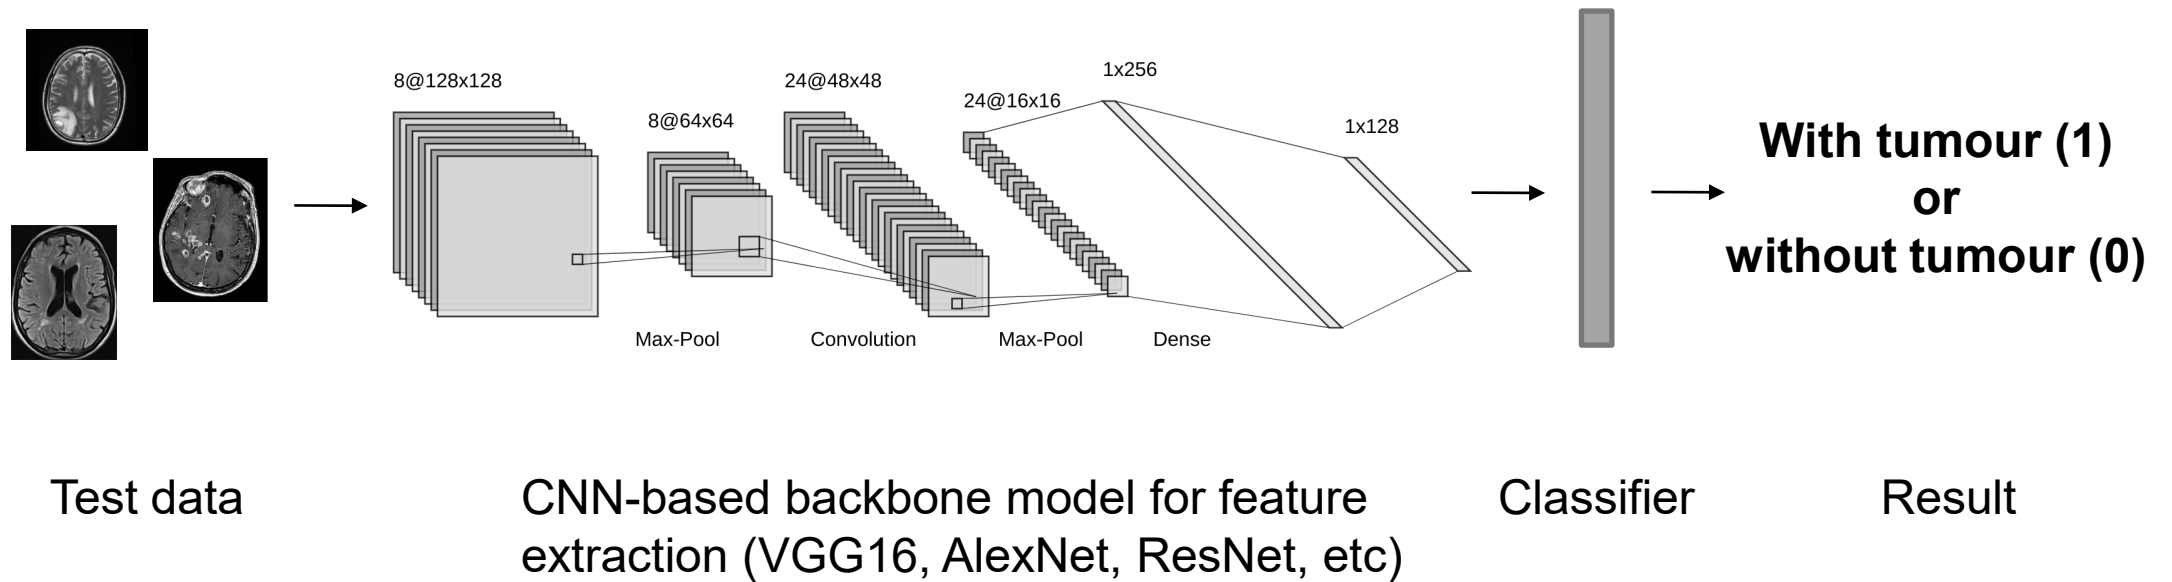

Train the classification model

Improve the accuracy of the prediction

- Choose the right augmentation methods to tackle the overfitting problem;
- Find the best backbone model;
- Choose to finetune the model or train it from the scratch;
- Set the number of epochs to train the model and early stopping criteria;
- Tune other hyperparameters to achieve the best performance.

Test the classification model

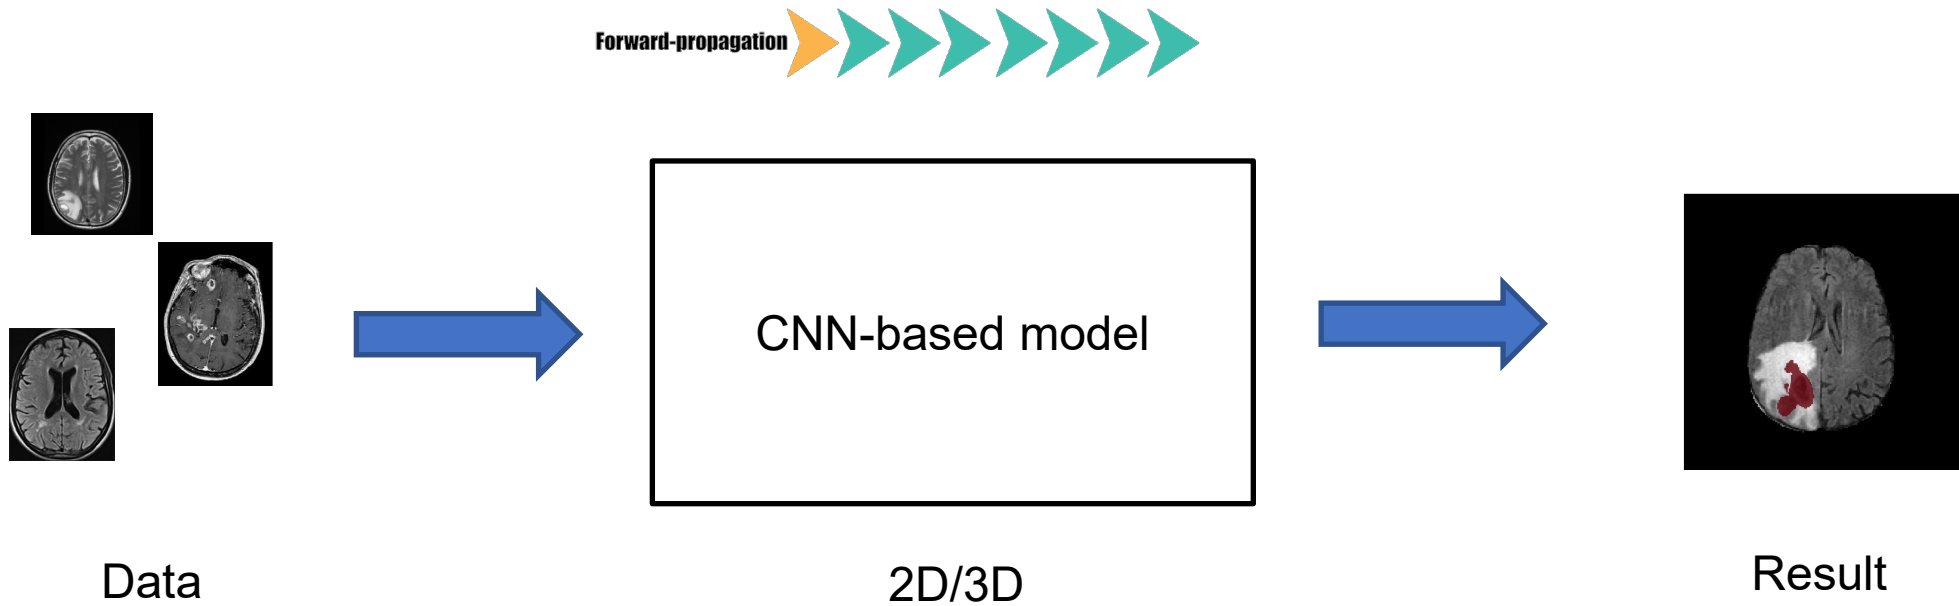

Result evaluation

Accuracy is used to evaluate the performance of your classification model, which is defined as

$$\text{Accuracy} = \frac{\text{Number of correctly classified images}}{\text{Number of total images}} \times 100\%$$

Segmentation model

Result evaluation

Dice score is used to evaluate the performance of your segmentation model, which is defined as

$$\text{Dice score} = (2 * \text{Area of Overlap}) / (\text{total pixels combined})$$

Agony of choice

- Model architecture: depth, width, scales, residuals,...
- Loss function: (weighted) cross-entropy, IoU, Dice,...
- Sampling strategy: equally per class, fore/background, uniform,...
- Optimization: optimizer, learning rate, momentum, regularization,...
- Data normalization/standardisation: z-score, bias field correction, histogram matching,...

Setting Up Python Development Environment

Anaconda Installation (2020.02)

<https://repo.anaconda.com/archive/>

For using Nvidia GPU

<https://github.com/antoniosehk/keras-tensorflow-windows-installation>

Packages:

Tensorflow

Scikit-learn

SimpleITK
